

Progress Task

Internship Opportunities at the Blazor, AJAX and Kendo UI Angular teams

Your task is to create a sample project that displays information about products i.e. online shop. An example collection of the products to be listed, could be found here:

<https://gist.github.com/Raisolution/2fa773f5b7009d4b7c487e7a0ae553c2>

Using this collection is **optional**. You could use **your own** or simply display the products **statically**.

Technical Details

- The task is just about demonstration of the products, there is **no need of implementing extended functionality** like adding products to a cart, making orders, and so on
- It is **up to you** to decide the styles and structure of the product list. You could **improvise** (e.g. by adding images)
- Try to visually distinguish products **in** and **out of stock**
- Include a text file with short description of your project (5-10 sentences in English) – what is the **technology used** in the project, what is the **general purpose** of it, the elements and components it consists of, etc.
- It is up to you to choose a technology for the project between:
 - [Blazor](#)
 - [ASP.NET Web Forms](#)
 - [Angular JavaScript Framework](#)
 - or just create a simple web page using pure HTML, CSS and JavaScript.

Optional

- Create a GitHub repository containing the application
- Use Telerik components to help you build the application
- Any feedback you can provide for the quality of the Telerik documentation/demos is a bonus for your work.
